M-1A CONTROL ELECTRONICS UNIT

The M-1 Control Electronics Unit has undergone a number of significant modifications. As a result of these changes Meyer Sound has renamed this product the **M-1A**. The following improvements are thus incorporated into this new model:

CONNECTIONS - The signal output stage has been improved so that Pin 2 or Pin 3 of the output connectors can be grounded without compromising the operation of the unit.

OPERATION - The M-1A LEVEL control has been converted to a precision ATTENUATION in dB. 0 (zero) dB attenuation on the M-1A represents the same gain as "10" on the M-1.

PRESET PANEL CONTROLS - The VHF VAR potentiometer on the Preset Panel has been changed on the M-1A to a single turn device from the 20 turn device used on the M-1. The new single turn potentiometer adjusts in the same direction as on the M-1.
